Basic MLTT has a constructive character that makes it well-suited for use in computational proof assistants: strong normalization of terms, decidability of type-checking, decidability of judgemental equality, canonicity, etc.

- Basic MLTT has a constructive character that makes it well-suited for use in computational proof assistants: strong normalization of terms, decidability of type-checking, decidability of judgemental equality, canonicity, etc.
- But when we add new axioms like Univalence and HITs, this constructive character is spoiled. Instances of UA cannot always be eliminated, and new primitive terms of higher Id-type need not reduce to normal forms.

- Basic MLTT has a constructive character that makes it well-suited for use in computational proof assistants: strong normalization of terms, decidability of type-checking, decidability of judgemental equality, canonicity, etc.
- But when we add new axioms like Univalence and HITs, this constructive character is spoiled. Instances of UA cannot always be eliminated, and new primitive terms of higher Id-type need not reduce to normal forms.

A "normalization up to homotopy" algorithm could partially restore the constructive character of the system.

- But when we add new axioms like Univalence and HITs, this constructive character is spoiled. Instances of UA cannot always be eliminated, and new primitive terms of higher Id-type need not reduce to normal forms.
- A "normalization up to homotopy" algorithm could partially restore the constructive character of the system.
- But, as recently shown by Coquand et al., a system with additional cubical structure seems to allow for such extensions while still retaining a constructive character.

- Basic MLTT has a constructive character that makes it well-suited for use in computational proof assistants: strong normalization of terms, decidability of type-checking, decidability of judgemental equality, canonicity, etc.
- But when we add new axioms like Univalence and HITs, this constructive character is spoiled. Instances of UA cannot always be eliminated, and new primitive terms of higher Id-type need not reduce to normal forms.
- A "normalization up to homotopy" algorithm could partially restore the constructive character of the system.
- But, as recently shown by Coquand et al., a system with additional cubical structure seems to allow for such extensions while still retaining a constructive character.
- This could lead to a proof of normalization up to homotopy for the original system via an interpretation. Moreover, it could also serve on its own as the basis of a new generation of proof assistants based on cubical HoTT.

Why cubical?

 Some success was had by Licata-Harper (2011) and Shulman (2013) in verifying the homotopy canonicity conjecture at low dimensions, using methods based on groupoids.

Why cubical?

- Some success was had by Licata-Harper (2011) and Shulman (2013) in verifying the homotopy canonicity conjecture at low dimensions, using methods based on groupoids.
- In recent and current work, Coquand and collaborators have devised an approach based on a constructive interpretation of HoTT in (different versions of) cubical sets, which are a form of ∞-groupoids.

Why cubical?

- Some success was had by Licata-Harper (2011) and Shulman (2013) in verifying the homotopy canonicity conjecture at low dimensions, using methods based on groupoids.
- In recent and current work, Coquand and collaborators have devised an approach based on a constructive interpretation of HoTT in (different versions of) cubical sets, which are a form of ∞-groupoids.
- Cubical sets are a combinatorial model of homotopy theory, introduced by Kan and still used in algebraic topology. Like the more familiar simplicial sets, they provide a more algebraic setting to study the homotopy theory of spaces.

- Cubical sets are a combinatorial model of homotopy theory, introduced by Kan and still used in algebraic topology. Like the more familiar simplicial sets, they provide a more algebraic setting to study the homotopy theory of spaces.
- ► Voevodsky's original model of UA used classical simplicial sets and is not constructive. Known models of HITs are also based on classical methods from the theory of ∞-toposes.

Cubes rule!

The cubical model suggests enriching the type theory itself with some additional cubical operations and equations which are present in the model, and which allow calculations that are otherwise available only "up-to-homotopy". This makes the system more computational.

Cubes rule!

- The cubical model suggests enriching the type theory itself with some additional cubical operations and equations which are present in the model, and which allow calculations that are otherwise available only "up-to-homotopy". This makes the system more computational.
- Coquand et al. have programmed a proof checker for such a cubical type theory, in which all terms — including those involving UA and some HITs — compute to normal forms.

The more structure one puts into the index category of cubes, the more "algebraic" the resulting model of type theory will be.

Like the simplicial category Δ , each of these cube categories can be presented by generating face and degeneracy maps (plus others).

Like the simplicial category Δ , each of these cube categories can be presented by generating face and degeneracy maps (plus others). But the **cartesian** cube category also has a simple description in terms of its Lawvere dual:

Like the simplicial category Δ , each of these cube categories can be presented by generating face and degeneracy maps (plus others). But the **cartesian** cube category also has a simple description in terms of its Lawyere dual:

Definition

The cartesian cube category $\mathbb{C} = \mathbb{C}_c$ is the opposite of the category \mathbb{B} of finite, strictly **bipointed sets**,

$$\mathbb{C} =_{\mathsf{def}} \mathbb{B}^{\mathsf{op}}.$$

Like the simplicial category Δ , each of these cube categories can be presented by generating face and degeneracy maps (plus others). But the **cartesian** cube category also has a simple description in terms of its Lawyere dual:

Definition

The cartesian cube category $\mathbb{C} = \mathbb{C}_c$ is the opposite of the category \mathbb{B} of finite, strictly **bipointed sets**,

$$\mathbb{C} =_{\mathsf{def}} \mathbb{B}^{\mathsf{op}}.$$

Write the bipointed sets:

$$[n] = \{0, x_1, ..., x_n, 1\}$$

So \mathbb{C} has the objects: [0], [1], ..., [n], ..., which we regard dually as the basic **n-cubes**.

 $\mathbb C$ is the free finite-product category on the bipointed object:

 $\left[0\right] \rightarrow\left[1\right] \leftarrow\left[0\right] ,$

(ロ)、(型)、(E)、(E)、 E) の(の)

which is then the universal cartesian interval.

 \mathbb{C} is the free finite-product category on the **bipointed object**:

 $\left[0\right] \rightarrow\left[1\right] \leftarrow\left[0\right] ,$

which is then the universal cartesian interval.

The basic cubes are then just the finite powers of [1],

$$[n] = [1] \times \ldots \times [1].$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 $\mathbb C$ is the free finite-product category on the **bipointed object**:

 $\left[0\right] \rightarrow\left[1\right] \leftarrow\left[0\right] ,$

which is then the universal cartesian interval.

The basic cubes are then just the finite powers of [1],

$$[n] = [1] \times \ldots \times [1].$$

The maps are those that can be composed from the \times -structure and the basic points $0, 1 : [0] \Longrightarrow [1]$.

 $\mathbb C$ is the free finite-product category on the **bipointed object**:

```
\left[ 0\right] \rightarrow\left[ 1\right] \leftarrow\left[ 0\right] ,
```

which is then the universal cartesian interval.

The basic cubes are then just the finite powers of [1],

$$[n] = [1] \times \ldots \times [1].$$

The maps are those that can be composed from the \times -structure and the basic points $0, 1 : [0] \Longrightarrow [1]$.

They can also be represented syntactically as the terms of a very simple **algebraic theory**.

Definition

The category **cSet** of (cartesian) **cubical sets** is the **presheaves** on \mathbb{C} . It is thus equal to the **covariant** functors on \mathbb{B} ,

$$\mathsf{Set}^{\mathbb{C}^{\mathsf{op}}} = \, \mathsf{Set}^{\mathbb{B}}$$
 .

The category **cSet** of (cartesian) **cubical sets** is the **presheaves** on \mathbb{C} . It is thus equal to the **covariant** functors on \mathbb{B} ,

$$\operatorname{\mathsf{Set}}^{\mathbb{C}^{\operatorname{op}}}=\operatorname{\mathsf{Set}}^{\mathbb{B}}$$
 .

The **cubes** in **cSet** are the *representable functors*:

$$I^n = \hom_{\mathbb{C}}(-, [n]).$$

Definition

The category **cSet** of (cartesian) **cubical sets** is the **presheaves** on \mathbb{C} . It is thus equal to the **covariant** functors on \mathbb{B} ,

$$\operatorname{\mathsf{Set}}^{\mathbb{C}^{\operatorname{\mathsf{op}}}}=\operatorname{\mathsf{Set}}^{\mathbb{B}}$$
 .

The **cubes** in **cSet** are the *representable functors*:

$$I^n = \hom_{\mathbb{C}}(-, [n]).$$

The **interval** object $I = hom_{\mathbb{C}}(-, [1])$ generates all the other cubes, which are closed under finite products and satisfy:

$$I^n \times I^m \cong I^{n+m}$$

The interval $1 + 1 \rightarrow I$ in **cSet** is **universal**, in the following sense. Theorem (A. 2015)

The category **cSet** of cubical sets is the **classifying topos** for strictly bipointed objects $(X, a, b, a \neq b)$.

The interval $1 + 1 \rightarrow I$ in **cSet** is **universal**, in the following sense. Theorem (A. 2015)

The category **cSet** of cubical sets is the **classifying topos** for strictly bipointed objects $(X, a, b, a \neq b)$.

This allows us to relate cSet to other logical and homotopical models in toposes.

The interval $1 + 1 \rightarrow I$ in **cSet** is **universal**, in the following sense. Theorem (A. 2015)

The category **cSet** of cubical sets is the **classifying topos** for strictly bipointed objects $(X, a, b, a \neq b)$.

- This allows us to relate cSet to other logical and homotopical models in toposes.
- Other models of type theory, such as Top and sSet, have a canonical comparision with cSet.
Cartesian cubical sets

The interval $1 + 1 \rightarrow I$ in **cSet** is **universal**, in the following sense. Theorem (A. 2015)

The category **cSet** of cubical sets is the **classifying topos** for strictly bipointed objects $(X, a, b, a \neq b)$.

- This allows us to relate cSet to other logical and homotopical models in toposes.
- Other models of type theory, such as Top and sSet, have a canonical comparision with cSet.
- ► Since C is a test category in the sense of Grothendieck, cSet has "the same" homotopy theory as classical spaces.

Cartesian cubical sets

The interval $1 + 1 \rightarrow I$ in **cSet** is **universal**, in the following sense. Theorem (A. 2015)

The category **cSet** of cubical sets is the **classifying topos** for strictly bipointed objects $(X, a, b, a \neq b)$.

- This allows us to relate cSet to other logical and homotopical models in toposes.
- Other models of type theory, such as Top and sSet, have a canonical comparision with cSet.
- Since ℂ is a test category in the sense of Grothendieck, cSet has "the same" homotopy theory as classical spaces.
- ► Moreover, the geometric realization cSet → Top preserves finite products.

The interval $1 + 1 \rightarrow I$ endows each cubical set A with a **canonical path object**,

 $A^{\mathrm{I}} \to A^{1+1} \cong A \times A$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

The interval $1 + 1 \rightarrow I$ endows each cubical set A with a **canonical path object**,

 $A^{\mathrm{I}} \to A^{1+1} \cong A \times A$.

The object A^{I} has the special property,

$$A_n^{\mathrm{I}} \cong \operatorname{hom}(\mathrm{I}^n, A^{\mathrm{I}}) \cong \operatorname{hom}(\mathrm{I}^n \times \mathrm{I}, A)$$

 $\cong \operatorname{hom}(\mathrm{I}^{n+1}, A) \cong A_{n+1}.$

So an *n*-cube of **paths** in A is an n + 1-cube in A.

The interval $1 + 1 \rightarrow I$ endows each cubical set A with a **canonical path object**,

 $A^{\mathrm{I}} \to A^{1+1} \cong A \times A$.

The object A^{I} has the special property,

$$A_n^{\mathrm{I}} \cong \operatorname{hom}(\mathrm{I}^n, A^{\mathrm{I}}) \cong \operatorname{hom}(\mathrm{I}^n \times \mathrm{I}, A)$$

 $\cong \operatorname{hom}(\mathrm{I}^{n+1}, A) \cong A_{n+1}.$

So an *n*-cube of **paths** in A is an n + 1-cube in A.

This **combinatorial specification** makes this path object very well-behaved. For example, it has not only a **left** adjoint ("cylinder") but also a **right** adjoint,

$$X \times I \dashv Y^I \dashv Z_I$$

Lemma

The interval I in cSet satisfies the "domain equation"

 ${\tt I}^{\tt I} \ \cong \ {\tt I}+1\,.$

Something similar happens in the object classifier and in the Schanuel topos. We can use this to calculate the right adjoint Z_{I} .

・ロト・日本・モート モー うへぐ

Lemma

The interval I in cSet satisfies the "domain equation"

 ${\tt I}^{\tt I} \ \cong \ {\tt I}+1\,.$

Something similar happens in the object classifier and in the Schanuel topos. We can use this to calculate the right adjoint Z_{I} .

Corollary

For the "amazing right adjoint" Z_I , we have:

$$Z_{\mathbf{I}}(n) \cong \operatorname{Hom}(\mathbf{I}^{n}, Z_{\mathbf{I}}) \cong \operatorname{Hom}((\mathbf{I}^{n})^{\mathbf{I}}, Z)$$

$$\cong \operatorname{Hom}((\mathbf{I}^{\mathbf{I}})^{n}, Z) \cong \operatorname{Hom}((\mathbf{I} + 1)^{n}, Z)$$

$$\cong \operatorname{Hom}(\mathbf{I}^{n} + C_{n-1}^{n}\mathbf{I}^{n-1} + \dots + C_{1}^{n}\mathbf{I} + 1, Z)$$

$$\cong Z_{n} \times Z_{n-1}^{C_{n-1}^{n}} \times \dots \times Z_{1}^{C_{1}^{n}} \times Z_{0},$$

where $C_k^n = \binom{n}{k}$ is the usual binomial coefficient.

We will use the canonical pathobject A^{I} to interpret the Id-**type**,

$$\operatorname{Id}_A = A^{\operatorname{I}}$$
.

・ロト・日本・モート モー うへぐ

We will use the canonical pathobject A^{I} to interpret the Id-type,

$$\operatorname{Id}_A = A^{\operatorname{I}}$$

This implies some new type-theoretic **equations** and **conditions**, such as:

$$\begin{split} \mathrm{Id}_{\mathrm{Id}_A} &= (A^{\mathrm{I}})^{\mathrm{I}} \cong A^{\mathrm{I} \times \mathrm{I}} \,, \\ \mathrm{Id}_{A+B} &= (A+B)^{\mathrm{I}} \cong A^{\mathrm{I}} + B^{\mathrm{I}} = \mathrm{Id}_A + \mathrm{Id}_B \,, \end{split}$$

and generally, the Id-type of a colimit is a colimit of Id-types.

We will use the canonical pathobject A^{I} to interpret the Id-type,

$$\operatorname{Id}_A = A^{\operatorname{I}}$$

This implies some new type-theoretic **equations** and **conditions**, such as:

$$\begin{split} \mathrm{Id}_{\mathrm{Id}_A} &= (A^{\mathrm{I}})^{\mathrm{I}} \cong A^{\mathrm{I} \times \mathrm{I}} \,, \\ \mathrm{Id}_{A+B} &= (A+B)^{\mathrm{I}} \cong A^{\mathrm{I}} + B^{\mathrm{I}} = \mathrm{Id}_A + \mathrm{Id}_B \,, \end{split}$$

and generally, the Id-type of a colimit is a colimit of Id-types.

The interpretation is thus **not** expected to be **conservative** indeed, one hopes to determine some new **cubical laws** that may be soundly added to the original theory

In order to use A^{I} as the Id-type, we are led to ask:

When does $A^{I} \rightarrow A \times A$ satisfy the rules for Id-types?

・ロト・日本・モート モー うへぐ

In order to use A^{I} as the Id-type, we are led to ask:

When does $A^{I} \rightarrow A \times A$ satisfy the rules for Id-types?

Theorem (A. 2015)

The path space $A^{I} \rightarrow A \times A$ satisfies the rules for Id-types if

- 1. The obect A is a Kan complex.
- 2. The dependent types $B \rightarrow A$ are Kan fibrations.

The notions of **Kan complex** and **Kan fibration** are determined by the usual **box-filling conditions**.

In order to use A^{I} as the Id-type, we are led to ask:

When does $A^{I} \rightarrow A \times A$ satisfy the rules for Id-types?

Theorem (A. 2015)

The path space $A^{I} \rightarrow A \times A$ satisfies the rules for Id-types if

- 1. The obect A is a Kan complex.
- 2. The dependent types $B \rightarrow A$ are Kan fibrations.

The notions of **Kan complex** and **Kan fibration** are determined by the usual **box-filling conditions**.

<ロト 4 回 ト 4 回 ト 4 回 ト 回 の Q (O)</p>

Proof.

- 1. Reduce Id-elim to transport and contraction.
- 2. Transport follows from path-lifting, i.e. 1-box filling.
- 3. Contraction follows from 1-box filling for $A^{I} \rightarrow A \times A$.
- 4. 1-box filling in $A^{I} \rightarrow A \times A$ is 2-box filling in A.

The last step of the foregoing is a special case of the following:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Lemma

The following are equivalent for a cubical set A.

- 1. (n+1)-box filling in A,
- 2. *n*-box filling in $A^{I} \rightarrow A \times A$,
- 3. 1-box filling in $A^{I^n} \to A^{\partial I^n}$.

The last step of the foregoing is a special case of the following:

Lemma

The following are equivalent for a cubical set A.

- 1. (n+1)-box filling in A,
- 2. *n*-box filling in $A^{I} \rightarrow A \times A$,
- 3. 1-box filling in $A^{I^n} \to A^{\partial I^n}$.

This can be used to prove a **converse** of the foregoing theorem: the box-filling conditions for cubical sets follow from the Id-rules together with Σ -types.

Cubical Lumsdaine

We can use the foregoing lemma to derive a **cubical version** of "Lumsdaine's Theorem" (aka "Lumsdaine-van den Berg-Garner"):

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Theorem (A. 2015)

Every type A in MLTT gives rise to a **cubical** ∞ -groupoid (a cubical set satisfying the box-filling conditions).

Cubical Lumsdaine

We can use the foregoing lemma to derive a **cubical version** of "Lumsdaine's Theorem" (aka "Lumsdaine-van den Berg-Garner"):

Theorem (A. 2015)

Every type A in MLTT gives rise to a **cubical** ∞ -groupoid (a cubical set satisfying the box-filling conditions).

We first need to determine the **cubical nerve of a type** A, i.e. a cubical set N(A):

$$N(A)_0 \stackrel{\longleftrightarrow}{\longleftrightarrow} N(A)_1 \stackrel{\longleftrightarrow}{\longleftarrow} N(A)_2 \stackrel{\longleftarrow}{\longleftarrow}$$

. . .

with:

$$N(A)_n \cong$$
 "*n*-cubes in A"

A pre-cubical structure on a type A arises as follows:

A **pre-cubical** structure on a type *A* arises as follows: Consider the **type-theoretic path object**:

$$P(X) = \sum_{x,y:X} \mathrm{Id}_X(x,y).$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

A **pre-cubical** structure on a type *A* arises as follows: Consider the **type-theoretic path object**:

$$P(X) = \sum_{x,y:X} \operatorname{Id}_X(x,y).$$

We have the usual (reflexive) globular maps:

$$A \xrightarrow{\longleftarrow} P(A) \xrightarrow{\longleftarrow} PP(A) \xrightarrow{\longleftarrow} \dots$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

A **pre-cubical** structure on a type *A* arises as follows: Consider the **type-theoretic path object**:

$$P(X) = \sum_{x,y:X} \mathrm{Id}_X(x,y).$$

We have the usual (reflexive) globular maps:

$$A \xrightarrow{\longleftarrow} P(A) \xrightarrow{\longleftarrow} PP(A) \xrightarrow{\longleftarrow} \dots$$

Since P also acts on maps by the "map on paths" operation, there are also the successive **images** of these maps under P:

$$A \xrightarrow{\longleftrightarrow} P(A) \xrightarrow{\longleftrightarrow} PP(A) \xrightarrow{\longleftrightarrow} \dots$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Rearranging, we find the usual cubical structure:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Rearranging, we find the usual cubical structure:

But we would need *P* to be **strictly functorial** for the cubical identities to hold!

Rearranging, we find the usual cubical structure:

But we would need *P* to be **strictly functorial** for the cubical identities to hold!

Instead, we need a more elaborate dependent indexing of the successive steps to make the cubical identities hold. This is still **not** a **cartesian** cubical set (it lacks diagonals!), but only a **monoidal** one.

Rearranging, we find the usual cubical structure:

Instead, we need a more elaborate dependent indexing of the successive steps to make the cubical identities hold. This is still **not** a **cartesian** cubical set (it lacks diagonals!), but only a **monoidal** one.

In cubical type theory we expect to have a cartesian cubical nerve.

A similar example is the **cubical nerve** $N(\mathbb{A})$ of a category \mathbb{A} . As a "pathobject" we can take the arrow category:

$$P(\mathbb{A}) = \mathbb{A}^{\rightarrow}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

which is strictly functorial.

A similar example is the **cubical nerve** $N(\mathbb{A})$ of a category \mathbb{A} . As a "pathobject" we can take the arrow category:

$$P(\mathbb{A}) = \mathbb{A}^{\rightarrow}$$

which is strictly functorial.

 $N(\mathbb{A})_n$ is then the set of **commutative** *n*-cubes in \mathbb{A} , i.e.

 $Cat(2^n, \mathbb{A}),$

where $2 = (\cdot \rightarrow \cdot)$ is the single-arrow category.

A similar example is the **cubical nerve** $N(\mathbb{A})$ of a category \mathbb{A} . As a "pathobject" we can take the arrow category:

$$P(\mathbb{A}) = \mathbb{A}^{\rightarrow}$$

which is strictly functorial.

 $N(\mathbb{A})_n$ is then the set of **commutative** *n*-cubes in \mathbb{A} , i.e.

 $Cat(2^n, \mathbb{A}),$

where $2 = (\cdot \rightarrow \cdot)$ is the single-arrow category.

We also have the usual "realization \dashv nerve" adjunction,

$$\mathsf{cSet} \longleftrightarrow \mathsf{Cat}$$
,

given by Kan extension along $\mathbb{C} \longrightarrow \mathbf{Cat}$, the cartesian classifying map of the interval $\mathbb{1} \to \mathbb{2} \leftarrow \mathbb{1}$ in **Cat**.

Theorem (A. 2015)

The cartesian nerve functor $N : Cat \longrightarrow cSet$ is full and faithful.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Theorem (A. 2015)

The cartesian nerve functor $N : Cat \longrightarrow cSet$ is full and faithful.

This uses the diagonals in an essential way and fails for the monoidal version of cubical sets.

Theorem (A. 2015)

The cartesian nerve functor $N : Cat \longrightarrow cSet$ is full and faithful.

- This uses the diagonals in an essential way and fails for the monoidal version of cubical sets.
- ► As in sSets, the categories A with a Kan nerve N(A) are exactly the groupoids.

Theorem (A. 2015)

The cartesian nerve functor $N : Cat \longrightarrow cSet$ is full and faithful.

- This uses the diagonals in an essential way and fails for the monoidal version of cubical sets.
- ► As in sSets, the categories A with a Kan nerve N(A) are exactly the groupoids.
- ► Cubical analogues of the orientals, the homotopy coherent nerve, and the notions of quasicategory and ∞-topos have not yet been studied.

Theorem (A. 2015)

The cartesian nerve functor $N : Cat \longrightarrow cSet$ is full and faithful.

- This uses the diagonals in an essential way and fails for the monoidal version of cubical sets.
- ► As in sSets, the categories A with a Kan nerve N(A) are exactly the groupoids.
- ► Cubical analogues of the orientals, the homotopy coherent nerve, and the notions of quasicategory and ∞-topos have not yet been studied.
- ► We expect the (cubical nerve of) the category of types in cubical homotopy type theory to be a cubical ∞-topos.

Univalence in cubical sets

The rough idea is this:

Univalence in cubical sets

The rough idea is this:

A path c : Id_U(A, B) in the universe U of types corresponds to a map c : I → U, since Id_U = U^I.

Univalence in cubical sets

The rough idea is this:

- A path c : Id_U(A, B) in the universe U of types corresponds to a map c : I → U, since Id_U = U^I.
- Such a map determines a **fibration** C → I over the 1-cube, with C₀ = A and C₁ = B.
Univalence in cubical sets

The rough idea is this:

- A path c : Id_U(A, B) in the universe U of types corresponds to a map c : I → U, since Id_U = U^I.
- Such a map determines a fibration C → I over the 1-cube, with C₀ = A and C₁ = B.
- Since there is a (distinguished) path p : Id_I(0,1) in I, and C → I is a fibration, we have the transport map

$$p_*: A = C_0 \to C_1 = B \,$$

which is an **equivalence** $A \simeq B$.

Univalence in cubical sets

The rough idea is this:

- A path c : Id_U(A, B) in the universe U of types corresponds to a map c : I → U, since Id_U = U^I.
- Such a map determines a fibration C → I over the 1-cube, with C₀ = A and C₁ = B.
- Since there is a (distinguished) path p : Id_I(0,1) in I, and C → I is a fibration, we have the transport map

$$p_*: A = C_0 \to C_1 = B \,$$

which is an **equivalence** $A \simeq B$.

► This is the map Id_U(A, B) → A ≃ B which by UA is supposed to have an inverse.
