

for example [Steenrod, 1951, p. 21].) In still another point of view, one uses collections of smooth functions on open subsets. (Compare [de Rham].) All of these definitions are equivalent.

In conclusion here are three problems for the reader. The first two of these will play an important role in later sections.

*Problem 1-A.* Let  $M_1 \subset \mathbb{R}^A$  and  $M_2 \subset \mathbb{R}^B$  be smooth manifolds. Show that  $M_1 \times M_2 \subset \mathbb{R}^A \times \mathbb{R}^B$  is a smooth manifold, and that the tangent manifold  $D(M_1 \times M_2)$  is canonically diffeomorphic to the product  $DM_1 \times DM_2$ . Note that a function  $x \mapsto (f_1(x), f_2(x))$  from  $M$  to  $M_1 \times M_2$  is smooth if and only if both  $f_1 : M \rightarrow M_1$  and  $f_2 : M \rightarrow M_2$  are smooth.

*Problem 1-B.* Let  $P^n$  denote the set of all lines through the origin in the coordinate space  $\mathbb{R}^{n+1}$ . Define a function

$$q : \mathbb{R}^{n+1} - \{0\} \rightarrow P^n$$

by  $q(x) = Rx = \text{line through } x$ . Let  $F$  denote the set of all functions  $f : P^n \rightarrow \mathbb{R}$  such that  $f \circ q$  is smooth.

a) Show that  $F$  is a smoothness structure on  $P^n$ . The resulting smooth manifold is called the *real projective space* of dimension  $n$ .

b) Show that the functions  $f_{ij}(Rx) = x_i x_j / \sum x_k^2$  define a diffeomorphism between  $P^n$  and the submanifold of  $\mathbb{R}^{(n+1)^2}$  consisting of all symmetric  $(n+1) \times (n+1)$  matrices  $A$  of trace 1 satisfying  $AA = A$ .

c) Show that  $P^n$  is compact, and that a subset  $V \subset P^n$  is open if and only if  $q^{-1}(V)$  is open.

*Problem 1-C.* For any smooth manifold  $M$  show that the collection  $F = C^\infty(M, \mathbb{R})$  of smooth real valued functions on  $M$  can be made into a ring, and that every point  $x \in M$  determines a ring homomorphism  $F \rightarrow \mathbb{R}$  and hence a maximal ideal in  $F$ . If  $M$  is compact, show that every maximal ideal in  $F$  arises in this way from a point of  $M$ . More generally, if there is a countable basis for the topology of  $M$ , show that every ring

homomorphism  $F \rightarrow \mathbf{R}$  is obtained in this way. (Make use of an element  $f \geq 0$  in  $F$  such that each  $f^{-1}[0, c]$  is compact.) Thus the smooth manifold  $M$  is completely determined by the ring  $F$ . For  $x \in M$ , show that any  $\mathbf{R}$ -linear mapping  $X: F \rightarrow \mathbf{R}$  satisfying  $X(fg) = X(f)g(x) + f(x)X(g)$  is given by  $X(f) = Df_x(v)$  for some uniquely determined vector  $v \in DM_x$ .
